

Executive summary

Tik Tok claim classification project

➤ ISSUE / PROBLEM

Tik tok data team aims to build a machine learning project to help classify claims for user submission. To get started, the team must first organize the raw dataset and prepare it for the upcoming exploratory data analysis (EDA)

➤ IMPACT

The impact of this preliminary analysis will be evident in the next steps.

In order to understand the impact of user videos, the data team identified two important variables to consider.

The variables video_view_count, video_like_count, video_comment_count, and video_share_count are both important factors to consider for future prediction models.

➤ RESPONSE

The data team conducted an initial analysis of the claim classification dataset to identify key variables and the relationship between them.

The team examined the count of claims and opinions to gain insights into the distribution of each type of video content

➤ KEY INSIGHTS

- The dataset shows a nearly equal distribution of opinions and claims. With this in mind, we can move forward with our analysis, confident that the dataset contains a balanced mix of both claims and opinions across the videos.
- Having identified the key variables and conducted an initial investigation of the claims classification dataset, we can now proceed with the exploratory data analysis.
